AP® COMPUTER SCIENCE A GENERAL SCORING GUIDELINES

Apply the question assessment rubric first, which always takes precedence. Penalty points can only be deducted in a part of the question that has earned credit via the question rubric. No part of a question (a, b, c) may have a negative point total. A given penalty can be assessed only once for a question, even if it occurs multiple times, or in multiple parts of that question. A maximum of 3 penalty points may be assessed per question.

1-Point Penalty

- (w) Extraneous code that causes side effect (e.g., printing to output, incorrect precondition check)
- (x) Local variables used but none declared
- (y) Destruction of persistent data (e.g., changing value referenced by parameter)

Mr Lee's 1-Point Penalty:

- Inefficient, "long winded" or "messy" difficult to understand code which takes longer to write than standard more efficient solutions.
 - In an exam you need to save time by writing quickly hand writable efficient code which is easy for AP readers to understand.

No Penalty

- Extraneous code with no side effect (e.g., precondition check, no-op)
- Spelling/case discrepancies where there is no ambiguity*
- Local variable not declared provided other variables are declared in some part
- Keyword used as an identifier
- Common mathematical symbols used for operators $(x \bullet \div \leq \geq <> \neq)$
- = instead of == and vice versa
- Missing {} where indentation clearly conveys intent
- Missing () around if or while conditions

^{*} Spelling and case discrepancies for identifiers fall under the "No Penalty" category only if the correction can be unambiguously inferred from context; for example, "total" instead of "totl". As a counterexample, that if the code declares "int G=99, g=0; ", then uses "while (G<10)" instead of "while (g<10)", the context does not allow for the reader to assume the use of the lower-case variable.

Strings - LightSequence FRQ

SHOW ALL YOUR WORK. REMEMBER THAT PROGRAM SEGMENTS ARE TO BE WRITTEN IN JAVA.

Assume that the classes listed in the Java Quick Reference have been imported where appropriate.

Unless otherwise noted in the question, assume that parameters in method calls are not null and that methods are called only when their preconditions are satisfied. In writing solutions for each question, you may use any of the accessible methods that are listed in classes defined in that question. Writing significant amounts of code that can be replaced by a call to one of these methods will not receive full credit.

Assume that the string oldSeq has been properly declared and initialized and contains a string of binary digits. Write a code segment that will remove the first occurrence of a string in segment from oldSeq and store it in the string newSeq. Consider the following examples.

If oldSeq is "1100000111" and segment is "11", then "00000111" should be stored in newSeq.

If oldSeq is "0000011" and segment is "11", then "00000" should be stored in newSeq.

If oldSeq is "1100000111" and segment is "00", then "11000111" should be stored in newSeq.

Write the code segment below. Your code segment should meet all specifications and conform to the examples.
